

ZPH Films: A Platform for Scalable Optoelectronics and Photovoltaics OTT 1828

Applications

Photovoltaics, UV Optoelectronics, Photonics & Plasmonics.

Target Problem

Most optoelectronic materials are costly, rigid, or difficult to scale. Silicon PVs dominate but deploy slowly and depend on overseas supply chains. UV-emitting materials are also expensive and complex. A scalable, multifunctional material is needed for domestic energy and sensing applications.

Solution

ZPH films are hydrated semiconductors offering low-cost, solution-based fabrication with strong UV-visible properties. They grow directly on metal or semiconductor substrates and pair with organic dyes to enable photovoltaic cells, UV photodetectors, and light-emitting devices.

Key Benefits

- **Scalable & Flexible:** Low-temp hydrothermal growth; compatible with roll-to-roll and curved surfaces
- **High UV Performance:** Narrow-band PL at ~378 nm; dye-sensitized cells up to 281 mV Voc
- **Multifunctional & Robust:** Supports sensors, emitters, and energy harvesting; mechanically and chemically stable

About this Technology

ZPH films are layered, hydrated zinc phosphate semiconductors fabricated via low-cost hydrothermal synthesis. They exhibit strong UV-visible photoluminescence and semiconductor-like charge transport. When interfaced with organic dyes, they form Type II heterojunctions that promote efficient charge separation and collection, enabling photovoltaic and photodetector operation. The films function in both dry and wet cell configurations, demonstrate zero-bias response, and can be integrated onto varied substrate geometries through scalable processing.

Stage of Development

Prototypes of ZPH-based photovoltaic and photodetector devices have been fabricated and tested. Current efforts focus on improving crystallinity, reducing thickness, and increasing efficiency.

Partnering Opportunity

UWM Research Foundation seeks partners to co-develop ZPH-based devices for energy, sensing, and photonics.

Intellectual Property

Patent pending. Protected and managed by the UWM Research Foundation.

Lead Inventors

[Nikolai Kouklin](#), PhD, Professor, Industrial & Manufacturing Engineering, & Computer Science

[Konstantin Sobolev](#), PhD, Professor, Civil and Environmental Engineering
